Doctor 08:41 AM

I'd like you to take your medication after breakfast every day.

Doctor 08:42 AM

If you experience any dizziness or nausea, please let us know.

Doctor 08:43 AM

We'll do a blood test in 2 weeks and follow up in 4 weeks.

Patient 08:43 AM

Okay, thank you doctor.

Care together

The hidden gap after every visit

Patients do not just need information. They need information they can remember, verify, and act on.

Sources: Kessels (2003); Anderson et al., systematic review on patient recall.

This gap becomes a safety problem

Misremembered instructions become missed medications, missed follow-ups, and unsafe self-management.

Source: WHO Patient Safety Fact Sheet, 2024.

Medication is the highest-risk moment

“Take this medicine once a day” is not enough — if the patient misses the name, dose, timing, or duration.

US\$42B

Estimated global cost of medication errors per year (WHO).

What patients commonly miss

- Exact medication name
- Dose and frequency
- Timing (before/after meals)
- Duration of treatment
- What to do if a dose is missed

Clariose → Schedule Agent generates drafts only. If name/dose/frequency is missing, the system forces an “Ask doctor or pharmacist” step.

Australia has a local communication gap

Even in a strong health system, patient experience and care coordination are uneven.

Communication signals — share of patients reporting "always"

Clariose → doesn't change clinician time. It gives the patient a real-time second memory layer.

Source: ABS Patient Experience Survey, 2024–25.

Caregivers are often out of the loop

The person who manages care at home is often not the person in the room.

Australia's unpaid carer population (millions)

Caregiver summary draft

User-confirmed sharing

No automatic sending

Why current solutions fall short

Existing solution	Gap
Audio recorder	Captures speech but does not structure or verify it
Discharge leaflet	Generic — not personalized to this patient or this visit
Patient portal notes	Often delayed, dense, and written for clinicians
Reminder app	Requires patient to understand and manually enter every detail
Generic chatbot	No realtime transcript grounding, no task confirmation

The missing layer: real-time capture + verification + confirmed, patient-actionable next steps.

From conversation to confirmed action

Clariose turns doctor visits into verified, actionable care tasks.

Summary

06
Human
Confirmation

Doctor speaks → Clariose captures → Agents verify → Missing details become questions → Instructions become draft tasks → Caregiver gets a draft summary → **nothing is activated without confirmation.**

How the technology works

Realtime voice captures the visit; a task-centric Codex agent team turns it into safe next steps.

Why realtime, why now

- OpenAI Realtime emits **conversation.item.input_audio_transcription.delta** and **completed** events.
- Each **completed** turn triggers the Codex multi-agent harness — partial in real time, structured at turn end.

The agent team

8 product agents implemented by technical Codex roles.

Safety Guardrail

Blocks unsafe outputs end-to-end

Each agent reads the **shared VisitState**, writes only its scoped fields, and links every output back to the transcript source.

Doctor

Let's review how you've been feeling since our last visit.

Patient

I still get breathless when climbing stairs and I've had some swelling in my ankles.

8. Safety Guardrail

Safety Check Pass

- ✓ No red flags detected
- ✓ Medication safe
- ✓ Guidelines aligned

7. Caregiver Update

Caregiver Note

Patient stable. Monitoring breathlessness and ankle swelling. Plan and meds reviewed. Next check-in next week.

6. Schedule Planner

Upcoming Plan

May 28	Blood Test
Jun 4	Follow-up Visit
Jun 11	Care Check-in

1. Coordinator

Care Summary — All Agents in Sync

All Good ✓

Key Takeaways

Breathlessness on exertion, ankle swelling. Monitoring and medication plan in place.

Plan

Medication, lifestyle, monitoring, follow-up and tests scheduled.

Next Steps

Follow-up visit on Jun 4. Caregiver updated.

4. Medical Extractor

Extracted Items

- Furosemide 40mg
- Low-sodium diet
- Monitor daily weight

5. Clarification

Follow-up Questions

- Any chest pain?
- How is your sleep?
- Any dizziness?

Safety by design

Clariose assists. It does not diagnose, prescribe, or override clinicians.

Clariose WILL always

- Treat every output as a draft
- Require human confirmation to activate
- Link every claim back to transcript source
- Force ambiguity into doctor-facing questions
- Block unsafe outputs at the guardrail

Clariose will NOT

- Diagnose conditions
- Change or recommend medications
- Send automatic reminders
- Share with caregivers automatically
- Activate any task without confirmation

Pattern: Draft → User confirms → Active. Never AI output → auto action.

Demo: a single sentence, end-to-end

DOCTOR SAYS

"Please take this medicine once a day after meals for three days."

What this single sentence shows

- Generic transcripts miss what patients need most
- Clariose turns gaps into doctor-ready questions
- Tasks stay drafts until the patient confirms

CLARIOSE OUTPUT

[✓] Transcript captured

Realtime, time-aligned

[!] Medication name missing

Flagged by Verification Agent

[!] Dose missing

Flagged by Medical Extractor

[?] Question for doctor

"Could you confirm the exact medication name and dose?"

[✍] Draft reminder + caregiver summary

Pending confirmation

Impact across the care journey

Clariose improves the weakest part of the journey: what happens after the conversation.

Stakeholder	Value delivered
Patients	Understand and remember instructions; act with confidence
Caregivers	Receive clear, confirmed summaries — no manual handoff
Doctors	Fewer repeated explanations and unsafe misunderstandings
Health systems	Better engagement; safer follow-through; up to 15% reduction in burden of harm (WHO)

Patient engagement done well can reduce the burden of harm by up to 15%. (WHO)

VISION

From one visit to a trusted care memory.
